

MARINE CLIMATE CONTROL SYSTEM

Provides Boatowners with Year Round Comfort

Quick, Quiet Cooling in Hot Weather. Warm in Cold Weather

Enjoy the luxury of a cool comfortable cabin in your boat even on the hottest summer day. Instant air conditioning at your fingertips-at a very affordable price.

As an added feature, the Westerbeke Marine Climate Control System also allows you to warm the cabin with the push of a button. Perfect for warming the cabin on cool nights, or for those extreme spring/autumn temperature changes.

The Westerbeke Marine Climate Control System also acts as a very efficient dehumidifier; it can be set to automatically remove excess humidity from the cabin even when the the boat is left closed up for long periods of time, eliminating the oppressive stickiness and damp mustiness common on boats.

All-Weather Comfort at Your Fingertips

For over 65 years, Westerbeke Corporation has been manufacturing world-class marine products. Westerbeke marine generators and engines are standard equipment on boats built by many of the world's leading boatbuilders. Thousands of "Westerbekes" have seen faithful service over the past six decades.

Westerbeke's Marine Climate Control System is the technical result of that marine experience. A state-of-the-art system, remarkably quite and efficient, designed to provide the boatowner with the ultimate in personal comfort.

The WESTERBEKE System Fits Any Size Boat

Westerbeke Marine Climate Control Systems are available in 10,000 and 17,000 BTU self-contained models, capable of being operated individually in small craft under 30 feet, or by combining two or more units, to air condition larger craft (up to 65 feet).

Two 10,000 BTU Westerbeke units can easily be run using a compact, lightweight Westerbeke 5.0 kW Marine Generator as a power source. Westerbeke's extensive experience with marine power products ensures the Westerbeke Climate Control Systems and Westerbeke marine generators are completely integrated. All Westerbeke products can be expertly installed and serviced by a world-wide network of Westerbeke dealers and distributors, giving you the convenience of "one-stop" shopping and service.

The unusually compact design permits convenient, easy installation in a small area (under a berth, helm station, or dinette seat).

These systems can also be installed by a do-it-yourselfer. Step-by-step installation instructions, which are easy to follow, accompany each system.

Engineered to be More Efficient

The Westerbeke Marine Climate Control System features a patented "V" shaped evaporator. This design, unique to Westerbeke, features a plenum with a large area that allows more even, unrestricted airflow across the entire surface of the evaporator coils.

The Westerbeke Marine Climate Control System's high performance fan, running silently on sealed ball bearings, creates a vortex and "pulls" more air, increasing cooling and dehumidification. Result: more comfort in less time.

The rotary compressor draws significantly fewer amps than the conventional reciprocating compressors on other air conditioners, and runs quieter.

The system has a unique enclosed self-draining tray to trap condensation and prevent spillage when rough water is encountered. No more wet carpet in your cabin-a problem common to conventional air conditioners.

User-Friendly Thermostat Controls

The digital controls automatically monitor air temperature, water temperature, line voltage, compressor current and fan speed. Operating failure modes are visually indicated by the service light on the panel. There is also special time-delay circuitry to prevent nuisance tripping of the circuit breakers when cooling or heating cycles are reversed too quickly.

In areas where moisture is a chronic problem, the digital display thermostat and control panel is another important feature of the Westerbeke Marine Climate Control System. Set the control in the "humidity mode," and the unit will automatically dehumidify the area, unattended, drawing up to several quarts of moisture, hourly, out of the cabin atmosphere.

Design-Integrated Components for a Self-Contained System

Virtually all components are specially designed for efficient operation in a marine environment. For example, "Y" and "T" ducting pieces formed from ABS plastic are aerodynamically contoured to eliminate back pressure, allowing for greater air flow which results in faster cooling and heating.

Westerbeke has a comprehensive selection of all accessories needed for installation. Air grills (both return and supply) are available in teak and aluminum.
